

Indexing plungers made of steel and stainless steel – designed and suitable for many applications

Indexing plungers GN 817, GN 817.2, GN 817.3 and GN 817.4

News from Ganter of Furtwangen

Ganter, makers of standard machine elements, have enlarged their unique indexing plunger range with the **GN 817.4** indexing plunger. These plungers feature a T-handle in place of a knob and are designed for use where greater unlocking forces are required.

In general, indexing plungers are suitable for the quick and safe locking of elements which slide against each other.

The pressure spring and the locking mechanism are integrated in the head or in the T-handle in all design variants of the **GN 817** standard element. This prevents dirt from entering the mechanism and guarantees the proper function at all times.

The design variants with lock nut are used in applications where the plunger pin must not protrude temporarily. In that case the knob or the T-handle is turned by 90° after retracting. A notch then keeps the plunger in that position.

All indexing plungers are offered with and/or without counter nut and with and/or without lock nut. Steel or stainless steel versions are obligatory.

For special knobs and for applications where the indexing plunger cannot be operated manually, Ganter offers the GN 817 indexing plungers also with a threaded pin.

GN 817.2 indexing plungers have a longer operating knob.

To allow reasonably priced precision positioning with the DIN 179 guide bushes, Ganter supplies the **GN 817.3** indexing plungers where the positioning accuracy does not depend on the indexing plunger guide of the bolt in the locking mechanism, but on the precision of the positioning guide and the bolt. Both elements are hardened and polished.
